15 ANGIOTENSIN II RECEPTOR BLOCKING COMPOSITIONSFIELD OF INVENTION

 This invention relates to pharmaceutical
compositions comprising angiotensin II receptor
20 antagonists, combined with other agents, particularly
diuretics, calcium channel blockers, β -adrenoceptor
blockers, renin inhibitors, or angiotensin converting
enzyme inhibitors. The invention also relates to a
method of treating hypertension by administering said
25 compositions to a subject in need thereof or by stepwise
combined therapy.

BACKGROUND OF THE INVENTION

 The class of peptide pressor hormone known as
30 angiotensin is responsible for a vasopressor action that
is implicated in the etiology of hypertension in man.
Inappropriate activity of the renin-angiotensin systems
appears to be a key element in essential hypertension,
congestive heart failure and in some forms of renal
35 disease. In addition to a direct action on arteries and
arterioles, angiotensin II (AII), being one of the most
potent endogenous vasoconstrictors known, exerts

- 2 -

stimulation on the release of aldosterone from the adrenal cortex. Therefore, the renin-angiotensin system, by virtue of its participation in the control of renal sodium handling, plays an important role in cardiovascular homeostasis.

Interruption of the renin-angiotensin system with converting enzyme inhibitors, such as captopril, has proved to be clinically useful in the treatment of hypertension and congestive heart failure (Abrams, W.B., et al., (1984), Federation Proc., 43, 1314). The most direct approach towards inhibition of the renin-angiotensin system would block the action of AII at the receptor. Compelling evidence suggests that AII also contributes to renal vasoconstriction and sodium retention that is characteristic of a number of disorders such as heart failure, cirrhosis and complications of pregnancy (Hollenberg, N.K., (1984), J. Cardiovas. Pharmacol., 6, S176). In addition, recent animal studies suggest that inhibition of the renin-angiotensin system may be beneficial in halting or slowing the progression of chronic renal failure (Anderson, S., et al., (1985), J. Clin. Invest., 76, 612). Also, a recent patent application (South African Patent Application No. 87/01,653) claims that AII antagonists are useful as agents for reducing and controlling elevated intraocular pressure, especially glaucoma, in mammals.

The compounds described herein inhibit, block and antagonize the action of the hormone AII, and are therefore useful in regulating and moderating angiotensin induced hypertension, congestive heart failure, renal failure and other disorders attributed to the actions of AII. When the AII receptor blocking compounds are administered to mammals, the elevated blood pressure due to AII is reduced and other manifestations based on AII intercession are minimized

and controlled. These compounds are also expected to exhibit diuretic activity.

One of the drawbacks of current antihypertensive therapy is that cardiovascular morbidity and mortality is higher in treated hypertensive patients than in normotensive subjects of the same age, sex, and from the same population [Isles, et al., J. Hypertension, 4, 141 (1986) and Samuelsson, O., Acta Med. Scand, Suppl. 702, 1 (1985)]. A possible explanation for this result is that arterial pressure in treated hypertensive patients is significantly higher than in matched normotensive subjects. Thus, it would appear that a therapeutic goal for the treatment of hypertension would be to obtain normotensive blood pressure levels in treated hypertensive patients [Hansson, L., Br. J. Clin. Pharmacol., 23, 15S (1987)]. To achieve this goal, the instant invention involves the administration of an angiotensin II receptor blocking compound in combination with a second agent, such as a diuretic, a calcium channel blocker, a β -adrenoceptor blocker, a renin inhibitor, or an angiotensin converting enzyme inhibitor.

According to the present invention there are provided pharmaceutical compositions comprising a pharmaceutically acceptable carrier in association with a diuretic and an angiotensin II blocking agent of formula (I) - (IX), hereinbelow.

- Compounds of formula (IX) are prepared following the methods described in Patent Cooperation Treaty Publication Number WO 91/16313, published October 31,
- 35 1991. Formula (IX) compounds are prepared as illustrated by Example 4.

The above descriptions on pages 3-18 of classes of AII receptor antagonists for use in the present invention were taken from the noted patent applications and publications. Reference should be made to such patent applications and
5 publications for their full disclosure, the entire disclosure of each of which is incorporated herein by reference.

Also included within the scope of this invention are pharmaceutical compositions comprising a pharmaceutically
10 acceptable carrier in association with a compound of formula (I) - (IX) and a second therapeutic agent, such as a diuretic, a calcium channel blocker, a β -adrenoceptor blocker, a renin inhibitor, or an angiotensin converting enzyme inhibitor.

15 This invention also relates to a method of treating hypertension by administering a compound of formula (I) - (IX) stepwise or in physical combination with a diuretic, a calcium channel blocker, a β -adrenoceptor blocker, a renin inhibitor, or an angiotensin converting enzyme inhibitor.

20 Most advantageously the compositions of this invention in dosage unit form are comprised of (E)-3-[2-n-butyl-1-((4-carboxyphenyl)methyl-1H-imidazol-5-yl)-2-(2-thienyl)methyl-2-propenoic acid, or a pharmaceutically acceptable salt thereof, and a diuretic, a calcium channel
25 blocker, a β -adrenoceptor blocker, a renin inhibitor, or an angiotensin converting enzyme inhibitor. Either can alternatively be used in the form of a non toxic salt.

Pharmaceutically acceptable acid addition salts of compounds of Formula (I) - (IX) are formed with appropriate
30 organic or inorganic acids by methods known in the art. For example, the base is reacted with a suitable inorganic or organic acid in an aqueous miscible solvent such as ethanol with isolation of the salt by removing the solvent or in an aqueous immiscible solvent when the acid is
35 soluble therein, such as ethyl ether or chloroform, with the desired salt separating directly or isolated by removing the solvent. Representative examples of suitable

- 20 -

acids are maleic, fumaric, benzoic, ascorbic, pamoic, succinic, bismethylenesalicylic, methanesulfonic, ethanedisulfonic, acetic, propionic, tartaric, salicylic, citric, gluconic, aspartic, stearic, palmitic, itaconic, glycolic, p-aminobenzoic, glutamic, benzenesulfonic, hydrochloric, hydrobromic, sulfuric, cyclohexylsulfamic, phosphoric and nitric acids.

Pharmaceutically acceptable base addition salts of compounds of Formula (I) - (IX) wherein a carboxy group is present are prepared by known methods from organic and inorganic bases, including nontoxic alkali metal and alkaline earth bases, for example, calcium, lithium, sodium, and potassium hydroxide; ammonium hydroxide, and nontoxic organic bases, such as triethylamine, butylamine, piperazine, meglumine, choline, diethanolamine, and tromethamine.

Angiotensin II antagonist activity of the compounds of Formula (I)-(IX) is assessed by in vitro and in vivo methods. In vitro antagonist activity is determined by the ability of the compounds to compete with ^{125}I -angiotensin II for binding to vascular angiotensin II receptors and by their ability to antagonize the contractile response to angiotensin II in the isolated rabbit aorta. In vivo activity is evaluated by the efficacy of the compounds to inhibit the pressor response to exogenous angiotensin II in conscious rats and to lower blood pressure in a rat model of renin dependent hypertension.

Binding

The radioligand binding assay is a modification of a method previously described in detail (Gunther et al., Circ. Res. 47:278, 1980). A particular fraction from rat mesenteric arteries is incubated in Tris buffer with 80 pM of ^{125}I -angiotensin II with or without angiotensin II antagonists for 1 hour at 25°C. The incubation is terminated by rapid filtration and receptor bound ^{125}I -angiotensin II trapped on the filter is quantitated with a

gamma counter. The potency of angiotensin II antagonists is expressed as the IC_{50} which is the concentration of antagonist needed to displace 50% of the total specifically bound angiotensin II. The IC_{50} of (E)-3-[2-n-butyl-1-((4-carboxyphenyl)methyl)-1H-imidazol-5-yl]-2-(2-thienyl)methyl-2-propenoic acid is about 1.0 nM.

Aorta

The ability of the compounds to antagonize angiotensin II induced vasoconstriction is examined in the rabbit aorta. Ring segments are cut from the rabbit thoracic aorta and suspended in organ baths containing physiological salt solution. The ring segments are mounted over metal supports and attached to force displacement transducers which are connected to a recorder. Cumulative concentration response curves to angiotensin II are performed in the absence of antagonist or following a 30-minute incubation with antagonist. Antagonist disassociation constants (K_B) are calculated by the dose ratio method using the mean effective concentrations. The K_B of (E)-3-[2-n-butyl-1-((4-carboxyphenyl)methyl)-1H-imidazol-5-yl]-2-(2-thienyl)methyl-2-propenoic acid is about 0.20 nM.

25 Inhibition of pressor response to angiotensin II in conscious rats

Rats are prepared with indwelling femoral arterial and venous catheters and a stomach tube (Gellai et al., Kidney Int. 15:419, 1979). Two to three days following surgery the rats are placed in a restrainer and blood pressure is continuously monitored from the arterial catheter with a pressure transducer and recorded on a polygraph. The change in mean arterial pressure in response to intravenous injections of 250 mg/kg angiotensin II is compared at various time points prior to and following the administration of the compounds intravenously or orally at doses of 0.1 to 300 mg/kg. The dose of compound needed to

produce 50% inhibition of the control response to angiotensin II (IC_{50}) is used to estimate the potency of the compounds. The IC_{50} of (E)-3-[2-n-butyl-1-((4-carboxyphenyl)methyl)-1H-imidazol-5-yl]-2-(2-thienyl)methyl-2-propenoic acid is about 0.1 mg/kg i.v. and about 5.5 mg/kg orally.

Antihypertensive activity

The antihypertensive activity of the compounds is measured by their ability to reduce mean arterial pressure in conscious rats made renin-dependent hypertensive by ligation of the left renal artery (Cangiano et al., J. Pharmacol. Exp. Ther. 208:310, 1979). Renal artery ligated rats are prepared with indwelling catheters as described above. Seven to eight days following renal artery ligation, the time at which plasma renin levels are highest, the conscious rats are placed in restrainers and mean arterial pressure is continuously recorded prior to and following the administration of the compounds intravenously or orally. The dose of compound needed to reduce mean arterial pressure by 30 mm Hg (IC_{30}) is used as an estimate of potency. The IC_{30} of (E)-3-[2-n-butyl-1-((4-carboxyphenyl)methyl)-1H-imidazol-5-yl]-2-(2-thienyl)methyl-2-propenoic acid is about 10.0 mg/kg orally.

The antihypertensive activity of the claimed pharmaceutical composition is determined using the spontaneously hypertensive rat model. The details of this in vivo test are found in Roesler, J.M., et al., J. Pharmacol. Exp. Ther., 236:1-7 (1986). The hypotensive effects of (E)-3-[2-n-butyl-1-((4-carboxyphenyl)methyl)-1H-imidazol-5-yl]-2-(2-thienyl)methyl-2-propenoic acid (Compound A) before and after hydrochlorothiazide (HCTZ) administration in this test system is presented in Table 1 below. These results indicate that diuretics enhance the hypotensive efficacy of AII receptor antagonists. Thus, a combined therapy of these two classes of drugs

will be likely to increase the response rate to therapy among hypertensive patients.

Table 1

Advantageously the angiotensin II blocking compounds of formula (I) - (IX) in a preparation comprising a pharmaceutical carrier, a second therapeutic agent selected from a diuretic, a calcium channel blocker, a β -adrenoceptor blocker, a renin inhibitor, or an angiotensin converting enzyme inhibitor will be present in an amount to treat hypertension in a subject in need thereof. The preparation contains the angiotensin II blocking compound in a dosage unit in an

amount from about .01-200 mg, preferably 1-100 mg.

The pharmaceutical carrier may be, for example, either a solid or a liquid. The administration may be parenterally, rectally, topically, transdermally or orally, the latter being the preferred route of administration. The pharmaceutical forms are, for example, syrups, suspensions or emulsions, tablets, capsules and lozenges.

A liquid formulation will generally consist of a suspension or solution of the compound or pharmaceutically acceptable salt in a suitable liquid carrier(s) for example, ethanol, glycerine, non-aqueous solvent, for example, polyethylene glycol, oils, or water with a suspending agent, preservative, flavouring or colouring agent.

The present invention also provides for a controlled release formulation to be administered to a mammal comprising a mixture of a micronised AII receptor antagonist and a second agent, such as a diuretic a calcium channel blocker, a β -adrenoceptor blocker, a renin inhibitor, or an angiotensin converting enzyme inhibitor, or pharmaceutically acceptable salts thereof, a water-channelling agent and a wetting agent. The mixture is in the form of a non-compressed pellet, having an enteric coat or a sustained release coat permeable to gastrointestinal juices. These slow release pharmaceutical compositions are prepared, for example, as described in U.S. Patent Number 4,524,060, issued June 18, 1985. Other controlled release formulations are described in U.S. Patent Number 4,880,830, issued November 14, 1989 and U.S. Patent Number 5,068,112, issued November 26, 1991.

The AII receptor antagonist compounds of this invention can also be administered in combination with other antihypertensives and/or diuretics and/or angiotensin converting enzyme inhibitors and/or calcium channel blockers. For example, the compounds of this

invention can be given in combination with such compounds as amiloride, atenolol, bendroflumethiazide, chlorothalidone, chlorothiazide, clonidine, cryptenamine acetates and cryptenamine tannates, deserpidine, 5 diazoxide, guanethidine sulfate, hydralazine hydrochloride, metolazone, metoprolol tartate, methyclothiazide, methyldopa, methyldopate hydrochloride, minoxidil, pargyline hydrochloride, polythiazide, prazosin, rauwolfia serpentina, 10 rescinnamine, reserpine, sodium nitroprusside, spironolactone, timolol maleate, trichloromethiazide, trimethophan camsylate, benzithiazide, quinethazone, ticynafan, triamterene, acetazolamide, aminophylline, cyclothiazide, ethacrynic acid, merethoxylline procaine, 15 sodium ethacrynate, delapril hydrochloride, enalaprilat, fosinopril sodium, lisinopril, pentopril, quinapril hydrochloride, ramapril, teprotide, zofenopril calcium, diflusal, diltiazem, felodipine, nicardipine, niludipine, minodipine, nisoldipine, nitrenedipine, 20 verapimil and the like, as well as admixtures and combinations thereof. The AII receptor antagonist compounds of this invention can also be administered in combination with a monoamine oxidase inhibitor, such as parnate.

25 To illustrate these combinations, one of the angiotensin II antagonists of this invention effective clinically in the 2.5-250 milligrams per day range can be effectively combined at levels at the 0.5-250 milligrams per day range with the following compounds at 30 the indicated per day dose range chlorothiazide (125-2000 mg), ethacrynic acid (15-200 mg), amiloride (5-20 mg), timolol maleate (5-60 mg), methyldopa (65-2000 mg), felodipine (5-60 mg) and nitrendipine (5-60 mg). In addition, triple drug combinations of 35 hydrochlorothiazide (15-200 mg) plus amiloride (5-20 mg) plus angiotensin II antagonist of this invention (3-200 mg) or hydrochlorothiazide (15-200 mg) plus timolol

maleate (5-60 mg) plus an angiotensin II antagonist of this invention (0.5-250 mg) of hydrochlorothiazide (15-200 mg) and nifedipine (5-60 mg) plus an angiotensin II antagonist of this invention (0.5-250 mg) are effective combinations to control blood pressure in hypertensive patients. Naturally, these dose ranges can be adjusted on a unit basis as necessary to permit divided daily dosage and, as noted above, the dose will vary depending on the nature and severity of the disease, weight of patient, special diets and other factors.

A composition in the form of a tablet can be prepared using any suitable pharmaceutical carrier(s) routinely used for preparing solid formulations. Examples of such carriers include magnesium stearate, starch, lactose, sucrose and cellulose.

A composition in the form of a capsule can be prepared using routine encapsulation procedures. For example, pellets containing the active ingredient can be prepared using standard carriers and then filled into a hard gelatin capsule; alternatively, a dispersion or suspension can be prepared using any suitable pharmaceutical carrier(s), for example aqueous gums, celluloses, silicates or oils and the dispersion or suspension then filled into a soft gelatin capsule.

A composition for parenteral administration which can be formulated as a solution or a suspension will generally consist of a solution or suspension of the active ingredient in a sterile aqueous carrier or parenterally acceptable oil, for example polyethylene glycol, polyvinyl pyrrolidone, lecithin, arachis oil or sesame oil. Alternatively, the solution can be lyophilised and then reconstituted with a suitable solvent just prior to administration.

A typical suppository composition comprises a compound of the instant invention or a pharmaceutically acceptable salt thereof which is active when administered in this way, with a

binding and/or lubricating agent such as polymeric glycols, gelatins or coca butter or other low melting vegetable or synthetic waxes or fats.

5 A typical transdermal formulation comprises a conventional aqueous or non-aqueous vehicle, for example, a cream, ointment lotion or paste or in the form of a medicated plaster, patch or membrane.

10 For topical administration, the pharmaceutical compositions adapted include solutions, suspensions, ointments, and solid inserts. Typical pharmaceutically acceptable carriers are, for example, water, mixtures of water and water-miscible solvents such as lower alkanols or vegetable oils, and water soluble ophthalmologically acceptable non-toxic polymers, for example, cellulose
15 derivatives such as methyl cellulose. The pharmaceutical preparation may also contain non-toxic auxiliary substances such as emulsifying, preserving, wetting, and bodying agents, as for example, polyethylene glycols; antibacterial components such as
20 quaternary ammonium compounds; buffering ingredients such as alkali metal chloride; antioxidants such as sodium metabisulfite; and other conventional ingredients such as sorbitan monolaurate.

The pharmaceutical preparations are made following
25 conventional techniques of a pharmaceutical chemist involving mixing, granulating, and compressing, when necessary, for tablet forms, or mixing, filling and dissolving the ingredients, as appropriate, to give the desired oral, parenteral, rectal, transdermal, or
30 topical products.

The compositions of this invention as described above are advantageously carried out in conjunction with a diuretic, particularly a thiazide diuretic, such as hydrochlorothiazide, or a loop diuretic, such as
35 furosemide. The amount of the diuretic present in a dosage unit is from about 1 mg to about 500 mg.

Also, the compositions of this invention as described above are advantageously carried out in conjunction with a calcium channel blocker, particularly dihydropyridine calcium antagonists, such as nifedipine.

5 The amount of the calcium channel blocker in a dosage unit is from about 5 mg to about 60 mg, preferably about 10 mg to about 30 mg.

Additionally, the compositions of this invention as described above are carried out in conjunction with a β -adrenoceptor blocker, such as propranolol. The amount

3-[2-n-Butyl-1-((2-chlorophenyl)methyl)-1H-imidazol-5-yl]-2-benzylpropanoic Acid

(i) 2-n-butyl-1-(2-chlorophenyl)methyl-1H-imidazole

- 5 Imidazole was converted to the 1-diethoxyorthoamide derivative by the method of Curtis and Brown, J. Org. Chem., (1980), 45, 20. Imidazole (12.8 g, 0.19 mol) and 118.4 g (0.8 mol) of triethylorthoformate were reacted in the presence of 1 g of p-toluenesulfonic acid
- 10 to give 20.6 (61%), bp 65-70°C (0.1 mm) of 1-diethoxyorthoamide imidazole. This product (24.0 g, 0.14 mol) was dissolved in dry tetrahydrofuran (250 mL), cooled to -40°C and n-butyl lithium (0.14 mol, 56.4 mL of 2.5 M in hexane) was added at -40°C to -35°C. After
- 15 15 minutes n-butyl iodide (31.1 g, 0.169 mol) was added at -40°C, and the reaction was stirred overnight at ambient temperature. The reaction was partitioned between ether and 0.3 N hydrochloric acid, and the organic layer was repeatedly extracted with dilute
- 20 hydrochloric acid. The combined aqueous extracts were neutralized with sodium bicarbonate solution, extracted with methylene chloride, dried over magnesium sulfate and concentrated. A flash distillation on a Kugelrohr apparatus provided 14.8 g (85%) of 2-n-butylimidazole.
- 25 2-n-Butylimidazole (9.7 g, 0.078 mol) was dissolved in methanol (50 mL) and added dropwise to a solution of sodium methoxide (from sodium hydride (2.31 g, 0.0934 mol) in methanol (250 mL)). After one hour the solution was evaporated to dryness, and the sodium salt was taken
- 30 up in dry dimethylformamide (150 mL) and 2-chlorobenzyl bromide (16.3 g, 0.079 mol) was added. The mixture was heated at 5 °C for 17 hours under argon, poured onto ice water and the product was extracted into ethyl acetate. The extract was washed, dried, and concentrated to give

- (ii) 2-n-butyl-1-(2-chlorophenyl)methyl-5-hydroxymethyl-1H-imidazole

Method 1

- A mixture of 2-n-butyl-1-(2-chlorophenyl)methyl-1H-imidazole (95.5 g, 0.384 mol), 37% formaldehyde (500 mL), sodium acetate (80 g) and acetic acid (60 mL) was heated to reflux for 40 hours under argon. The reaction was concentrated in vacuo, and the residue was stirred with 500 mL of 20% sodium hydroxide solution for 4 hours, diluted with water and extracted with methylene chloride. The extract was washed, dried, and concentrated. The crude product (117 g) was flash chromatographed over 600 g of silica gel with a gradient of ethyl acetate to 10% of methanol in ethyl acetate to give 8.3 g of starting material, 24.5 g of a mixture of starting material and product, and 44 g (41%) of 2-n-butyl-1-(2-chlorophenyl)methyl-5-hydroxymethyl-1H-imidazole; mp 86-88°C (from ethyl acetate). Further elution provided the bis (4,5-hydroxymethyl) derivative; mp 138-140°C (from ethyl acetate).

Method 2

- A mixture of valeramidine methyl ether hydrochloride (250 g, 1.66 mol) and dihydroxyacetone (150 g, 0.83 mol) dissolved in liquid ammonia was allowed to stand overnight at room temperature in a pressure vessel, and then heated at 65°C for 4 hours at 375 psi. The ammonia was allowed to evaporate, and the residue was dissolved in methanol (3L). The resulting slurry was refluxed with added acetonitrile (1L). The solution was decanted from the solid ammonium chloride while hot. This procedure was repeated, and the combined acetonitrile extracts were treated with charcoal, filtered hot and the filtrate was concentrated

in vacuum to give the dark oil, 2-n-butyl-5-hydroxymethylimidazole (253 g, 1.63 mol, 98%).

This crude alcohol (253 g) was treated with acetic anhydride (400 mL) at -15°C and then was allowed to warm
5 to ambient temperature with stirring, and then stirred an additional 19 hours. The acetic anhydride was evaporated at reduced pressure, the residue taken up in methylene chloride, and the organic phase was washed with 5% sodium bicarbonate solution and water. The
10 extract was dried over sodium sulfate and concentrated to give 323 g (83%) of 1-acetyl-4-acetoxymethyl-2-n-butylimidazole.

This diacetate was N-alkylated by the following procedure. To a solution of triflic anhydride (120 mL,

20 minutes at -78°C, this solution was then treated with 1-acetyl-4-acetoxymethyl-2-n-butylimidazole (146 g, 0.61 mol) dissolved in methylene chloride (300 mL) over a 20-minute interval. The mixture was then stirred at ambient temperature for 18 hours and the solvents were
25 evaporated, The residual 2-n-butyl-5-acetoxymethyl-1-(2-chlorophenyl)methyl-1H-imidazole was used without purification for the hydrolysis of the acetate group.

20 of 2-n-butyl-1-(2-chlorophenyl)methyl-5-chloromethyl-1H-imidazole hydrochloride (3.5 g, 0.0105 mol) in dimethylformamide (40 mL) was added over 5 minutes. The reaction mixture was stirred at 25°C for 18 hours, then partitioned between water and methylene chloride. The
25 organic layer was washed with water, dried, and concentrated. The crude product was flash chromatographed over silica gel to give 4.54 g (85%) of the title compound as an oil.

35 refluxed for 4 hours. The ethanol was evaporated, the residual aqueous layer was extracted with diethyl ether, and the basic solution was adjusted to pH 3.75 with

concentrated hydrochloric acid. The precipitated product was extracted into methylene chloride, dried, and concentrated. This crude product was flash chromatographed on silica gel with 10% methanol in methylene chloride to give 0.51 g (86%) of 3-[2-n-butyl-1-((2-chlorophenyl)methyl)-1H-imidazol-5-yl]-2-benzylpropanoic acid; mp 118-120°C (from acetone/diethyl ether as the hydrochloride salt).

crystallized from a large volume of methanol to provide 7.85 g (61.5%) of the yellow crystalline 5-bromo-2-[(2-chlorophenyl)methyl]amino-3-nitrobenzoic acid; mp 159-161°C.

- 5 (iii) 5-bromo-2-[(2-chlorophenyl)methyl-N-valeryl]amino-3-nitrobenzoic acid

A solution of 5-bromo-2-[(2-chlorophenyl)methyl]-amino-3-nitrobenzoic acid (8 g, 0.021 mmol) in pyridine (100 mL) was cooled in ice under argon and valeryl
10 chloride (5.5 g, 0.046 mol) was added. The mixture was heated at 45°C for 18 hours, poured into water, acidified with hydrochloric acid and the oily product was extracted into ethyl acetate. The organic extracts
15 were washed with 10% hydrochloric acid solution and brine, and the dried, concentrated product afforded about 100% yield of the crude oil, 5-bromo-2-[(2-chlorophenyl)methyl-N-valeryl]-amino-3-nitrobenzoic acid, which was used without further purification.

- 20 (iv) 5-bromo-2-n-butyl-1-(2-chlorophenyl)methyl-1H-benzimidazole-7-carboxylic acid

A solution of 5-bromo-2-[(2-chlorophenyl)methyl-N-valeryl]amino-3-nitrobenzoic acid (9.72 g, 0.0207 mol) in tetrahydrofuran (75 mL) was diluted with 5% sodium bicarbonate solution (75 mL), and then treated
25 portionwise with sodium hydrosulfite (12 g) over 2 hours. The pH was adjusted to 7.1 with additional solid sodium bicarbonate. After an hour of stirring, 6 g of additional sodium hydrosulfite was added, and, after another hour of stirring, the mixture was filtered,
30 diluted with ether, and the layers were separated. The organic phase was concentrated to a solid that was dissolved in acetic acid (15 mL) and concentrated hydrochloric acid (5 mL) and heated on a steam bath for 2 hours. The residual slurry was concentrated in vacuo,
35 diluted with water and the solid was collected. The solid was dissolved in hot methanol, some insolubles filtered off, and the filtrate was concentrated to

incipient crystallization. After chilling, there was obtained 4.26 g (37%) of 5-bromo-2-n-butyl-1-(2-chlorophenyl)methyl-1H-benzimidazole-7-carboxylic acid; mp 254-255°C.
